

New Explanation for Why Black Holes Are Invisible

Gh. Saleh

Saleh Research Centre, Netherlands

Black holes are so massive that not even light can escape their gravitational pull, so by their nature they are invisible. This is the famous reason that we know, but it needs some prefix. And also it is not the only one. The other could relate to its structure.

If we look at the star, planet and also an atom structure, we could find the structure for the black hole too. Black holes have a surrounding area and the more compact center.

In this paper we are going to explain more about this structure and we will introduce other reason that causes the black hole invisible.
