

A new explanation for the nature, structure, etc. of gravity in the universe

Gh. Saleh

Saleh Research Centre, Netherlands

Stars and planets revolve in orbits around each other which there are Gravitational Force Lines between them. In fact, the kinetic energy of the planets has been always equal to the energy of the gravitational waves and causes equilibrium. Therefore, the kinetic energy must be equal to the gravitational energy.

In this article we have proved that the structure that is interconnected in a ring-to-ring feature and travels between the star and planet is responsible for such equilibrium and the gravitational fluxes are firm and steady toward the linear direction, and they have curvature property to the perpendicular direction.
