

# A Novel and Simple Explanation of the Entire Structure of the Physical Cosmos, from Smallest to Largest

*Gh. Saleh*

*Saleh Research Centre, Netherlands*

Whenever we look at the world around us, we see the Earth beneath our feet and the sky or the Moon above. It was these same phenomena that, in the past, led people to believe that the Earth was the centre of the universe and that everything revolved around it. However, with the passage of time, this misconception gave way to the truth, and it became clear that the Sun is at the centre of the solar system and that planets, such as Earth, orbit it.

To define the smallest structures to the largest ones, we must first look to planets and the moons that orbit them. Next are the stars and planets that form star systems (or solar systems). After that come the galaxies, in which stars orbit a central black hole. Above the galaxies are galaxy clusters, which are formed by the aggregation of several galaxies. Following the clusters are superclusters, which are themselves collections of clusters.

A collection of superclusters makes up the Universe, and then a collection of Universes together forms the **Meta-Universe**. At the final level, Meta-Universes, when combined, create the **Great World**.

Therefore, the structure of the physical cosmos is as follows:

- 1- Planets and moons
- 2- Stars and planets (solar systems)
- 3- Collection of solar systems that form galaxies
- 4- Collection of galaxies that form clusters
- 5- Collection of clusters that form superclusters
- 6- Collection of superclusters that form the universe
- 7- Collection of universes that form the Meta-Universe
- 8- Collection of meta-universes that create the Great World.
