

New Discovery of the High-Energy Particle Amaterasu (Cidtonium) and Theoretical Derivation of Its Frequency, Mass, Energy, Speed, etc., in the Universe 2026

C) Characteristics of the Amaterasu Particle (Cidtonium)

Gh. Saleh

Saleh Research Centre, Netherlands

Based on the thinking of the ancients, which forms the scientific foundation of today's world, the elements were divided into 4 principal categories: water, earth, air, and fire. As human knowledge advanced over time, it was understood that these 4 principal elements possessed elementary particles known as atoms, and that atoms, in turn, constitute the elements of the Mendeleev (periodic) table, which comprises approximately 118 elements.

Initially, a number of the elements of the Mendeleev periodic table were discovered; over time, further elements were discovered, and the periodic table was completed. Subsequently, with further scientific advancement, it was understood that atoms themselves are composed of 3 elementary particles, namely electron, proton, and neutron.

Saleh Theory holds that the elementary particles of atoms (electron, proton, neutron) likewise possess an elementary particle known as photon, and that the photon in turn possesses a constituent particle known as Amaterasu (Cidtonium). It is predicted that the Amaterasu particle itself will likewise possess elementary particles. In light of the above, the following table may be defined for the Amaterasu particle:

Speed (m/s)	Angular Speed (rad/s)	Frequency (Hz)	Wavelength (m)	Density (kg/m ³)	Mass (kg)	Energy (j)	Constant of Energy (j.s)
4.8 C	1.2×10^{26}	1.9×10^{25}	7.58×10^{-15}	$10^{18} - 10^{23}$	1.64×10^{-39}	1.7×10^{-21}	8.9×10^{-47}
